SURFACES IN DENTAL PRACTICES ARE AT A HIGHER RISK

than previously thought of spreading infection during dental procedures.

Disease causing
Hepatitis C Virus

Disease causing
Hepatitis B Virus

Meet
the
Culprits

Infection causing
Methicillin-resistant *Staphylococcus Aureus* (MRSA)

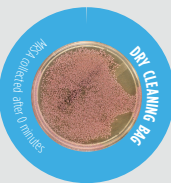

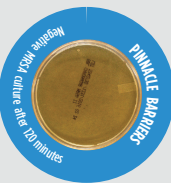

Disease causing
Mycobacterium Tuberculosis var. bovis (TB)

PLUS *Candida*, *Clostridium Difficile* spores, Vancomycin-resistant *Enterococci* (VRE)

3 BARRIERS WERE TESTED

See how effective each barrier was at reducing microbial penetration of methicillin-resistant *Staphylococcus Aureus* (MRSA)

2 Effective Ways TO REDUCE CROSS CONTAMINATION:

Single-use disinfectant wipes, ideal for disinfecting hard non-porous materials.

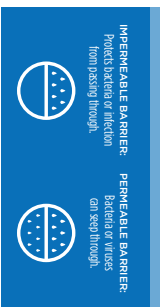

Single-use disposable barrier covers. Best protects equipment that comes into patient contact.

Did You Know?

Organisms found on surfaces can survive longer than you may think:

- HERC** 1 day to 1 month
- CANDIDA** 1 day to 3 months
- TUBERCULOSIS** 1 day to 4 months
- CLOSTRIDIUM DIFFICILE SPORES** 1 day to 5 months
- HEPATITIS B** 1 month to 6 months
- MRSA** 7 days to 7 months

Not all Barriers ARE CREATED EQUAL

Reduce use of potentially harmful chemicals

Single-use and disposable

Provide an impervious surface barrier

6 Considerations FOR USING BARRIER COVERS:

These are estimated survival times in the real world. For more details, Number 29, HealthCare Infection Control, Vol. 10, Number 1, 2005, www.ascdental.org/online/050105survival.html
